**ABSTRACT**

A switch image control system includes at least one first switch having a first image viewable when a backlighting is applied to the at least one first switch. The system also includes at least one second switch having a second image viewable when the backlighting is applied to the at least one second switch. The backlighting is independently applicable to either or both of the at least one first switch and the at least one second switch.

## SWITCH IMAGE CONTROL SYSTEM AND METHOD

This application is a divisional of U.S. application Ser. No. 12/614,880, filed Nov. 9, 2009, which is expressly incorporated herein by reference.

### BACKGROUND

Exemplary embodiments herein generally relate to vehicle control switches, and more particularly relate to selectively illuminated images on vehicle control switches.

Conventional vehicle control switches, such as audio and HVAC switches, typically have printed or etched text and/or icons thereon. The text and/or icons identify the function of the particular switch. The printed or etched text and/or icons are generally always visible if sufficient ambient light is present within the vehicle cabin. Sometimes the printing or etching is also backlightable for nighttime viewing in addition to being viewable with ambient light during the daytime.

More recently, some vehicle manufacturers have been using "black-out" technology. Such technology allows an image to be viewable only when it is backlit. That is, the image is not viewable regardless of the amount of ambient or other light present. Rather, viewing of the image is only possible when backlighting of the image occurs.

Conventional uses of such black-out technology in vehicles include providing an indicator of the status or condition of a vehicle component. For example, an OFF indicator is only viewable via backlighting when an associated passenger airbag is disabled or non-functional. Another vehicle manufacturer presently employs touch sensor switches on the driver's side door. These switches include images that are only viewable upon backlighting. To actuate backlighting of these switches, which can be used to unlock the vehicle when a predetermined code is entered through the switches, the user swipes his or her hand over the switches.

Still other others have been known to employ touch sensor switches for audio and HVAC systems in vehicles that employ black-out technology. For example, one known control panel includes mode selector buttons that, when selected, change the operating mode of a control switch (e.g., to HVAC mode or audio mode). In addition, certain switches and displays around the control switch become visible on the control panel corresponding to the selected selector button and its operating mode. Other switches and displays are not visible until their corresponding selector button (and mode) is selected.

### SUMMARY

In accordance with one aspect, a switch image control system is provided for a vehicle including at least one first switch corresponding to a first vehicle sub-system having a first image viewable when backlighting is applied to said at least one first switch and at least one second switch corresponding to a second vehicle sub-system having a second image viewable when said backlighting is applied to said at least one second switch. The backlighting is independently applicable to either or both of the at least one first switch and the at least one second switch based on at least one operating condition of the vehicle.

According to another aspect, a switch image control system is provided for a vehicle. More particularly, in accordance with this aspect, the system includes a first group of switches having first images viewable thereon when backlighting is applied thereto, the first group of switches corresponding to a first vehicle sub-system. The system also

includes a second group of switches having second images viewable thereon when said backlighting is applied thereto, the second group of switches corresponding to a second vehicle sub-system. The system additionally includes a third switch having a third image viewable thereon when said backlighting is applied thereto. The backlighting is selectively and independently applied to one or one or more of the first group of switches, the second group of switches, the third switch based on at least one operating condition of the vehicle.

According to yet another aspect, a switch image control method is provided for a vehicle. The method includes providing at least one first switch having a first image corresponding to a first vehicle sub-system and providing at least one second switch having a second image corresponding to a second vehicle sub-system. The method further includes selectively and independently backlighting one or both of the at least one first switch to illuminate the first image and the at least one second switch to illuminate the second image based on at least one operating condition of the vehicle.

### BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a schematic view of a switch image control system for a vehicle.

FIG. 2A is a diagram of two switches shown in a backlight OFF condition.

FIG. 2B is a schematic view of the same two switches shown in a backlight ON condition.

FIG. 3 is a schematic view of a switch image control system for an audio system and an HVAC system in a vehicle.

FIG. 4 is an exemplary control matrix for selectively and independently backlighting control switches of the HVAC system and audio system of FIG. 3.

FIGS. 5A-5G show views of HVAC control switches and audio control switches corresponding to the control matrix of FIG. 4.

FIG. 6 is a flow chart illustrating a switch image control method for a vehicle.

### DETAILED DESCRIPTION

Referring now to the drawings wherein the showings are for the purposes of illustrating one or more exemplary embodiments, FIG. 1 schematically illustrates a switch image control system for a vehicle, the system generally designated by reference numeral 10. The system 10 includes at least one first switch (e.g., switch 12) having a first image 14 viewable when a backlighting 20 is applied to the switch 12. The system 10 further includes at least one second switch (e.g., switch 16) having a second image 18 viewable when the backlighting 20 is applied to the second switch 16. Backlighting 20 can be independently applicable to either or both of the at least one first switch 12 and the at least one second switch 16. In particular, the first and second switches 12, 16 can employ black-out technology that allows the first image 14 to be viewable only when the backlighting 20 is applied to the first switch 12 and likewise allows the second image 18 to be viewable only when the backlighting 20 is applied to the second switch 16. In an exemplary embodiment, as will be described in more detail below, the backlighting 20 can be applied to one or both the first and second switches based on at least one operating condition of the vehicle.

The first and second images 14, 16 on the switches 12, 16 can be comprised of text and/or icons, which can be representative of the function of the switch. By using black-out technology, the first switch 12 has a black-out appearance

3

(i.e., the first image is not viewable) when the backlighting 20 is not applied to the first switch 12. Similarly, the second switch 16 has a black-out appearance (i.e., the second image 18 is not viewable) when the backlighting 20 is not applied to the second switch 16. As will be described in more detail below, backlighting of the images on the switches can be used to indicate the active status of the switches and/or the underlying devices or systems corresponding to the switches.

With additional reference to FIGS. 2A and 2B, a pair of switches 112, 116, which could be the first and second switches 12, 16, is illustrated. In FIG. 2A, the illustrated switches 112, 116 have a black-out appearance and thus images of these switches 112, 116 are not viewable. As shown, the “black-out” appearance of the switches 112, 116 (FIG. 2A) is a blank non-descriptive appearance. In FIG. 2B, backlighting for the illustrated switches 112, 116 is turned on and thus images of the illustrated switches 112, 116 are viewable (e.g., “AM/FM” and “((XM)))”). Ambient lighting, or lighting other than the backlighting, has no effect on the viewability of the switches 112, 116. Accordingly, images of the switches 112, 116 cannot be seen with the provision of ambient light absent backlighting.

Likewise, with reference back to FIG. 1, the first image 14 and the second image 18 are not visible with ambient lighting when the backlighting 20 is not applied to the first switch 12 and the second switch 16. In addition to ambient lighting, the first image 14 and the second image 18 are not visible even with front side lighting (e.g., vehicle cabin lighting, such as a dome light) when the backlighting 20 is not applied to the first and second switches 12, 16. Only the application of the backlighting 20 to the switches 12, 16 enables viewing of the respective images 14, 18 thereon.

In addition to providing a neat styling effect, backlighting of the images 14 or 18 on the switches 12, 16 (or the absence thereof) can be used to provide further information to a vehicle user. More particularly, in one embodiment, application of the backlighting 20 to the first switch 12 can correspond with an operational status of the first switch 12. Likewise, application of the backlighting 20 to the second switch 16 can correspond to the operational status of the second switch 16. In contrast to conventional images provided on vehicle switches, which allow images on the switches to be seen with ambient light, the system 10 can use the backlighting or absence of backlighting (i.e., switch images turned on or off) to reflect the operational status of the switches. In one embodiment, the operational status of the first switch 12 is active when the backlighting 20 is applied to the first switch 12 and the first image 14 is illuminated, and inactive when the backlighting 20 is not applied to the first switch 12 and the first image 14 is blacked out. Similarly, the operational status of the second switch 16 can be active when the backlighting 20 is applied to the second switch 16 and the second image 18 is illuminated, and inactive when the backlighting 20 is not applied to the second switch 16 and the second image 18 is blacked-out.

As shown in FIG. 1, the first switch 12 can correspond to a first vehicle sub-system 26 and the second switch 16 can correspond to a second vehicle sub-system 28. As is known and understood by those skilled in the art, input from the first switch 12 (e.g., depression of the first switch) can be received or communicated to a sub-system controller 30 of the first sub-system 26. Similarly, the second switch 16 can be associated with a sub-system controller 32 of the second sub-system 28 such that actuation of the second switch 16 (e.g., by depression thereof) is communicated to the sub-system controller 32. The backlighting source 20 can be operatively connected to the switches 12, 16 as schematically indicated at

4

34 and 36 such that backlighting of the switches 12, 16 via the backlighting 20 is selectively and independently controllable. In one embodiment, a backlighting controller 38 is included in the system 10 for controlling backlighting 20 to the switches 12, 16. The backlighting controller 38 can be linked to the sub-system controllers 30, 32 of the sub-systems 26, 28, respectively, such that the backlighting controller 38 receives indications from the controllers 30, 32 as to when backlighting of the switches 12 and 16 is to be turned on and off.

The backlighting controller 38 can additionally receive status or condition signals from other vehicle sub-systems, components, devices, etc., such as from the ignition state controller 40, particular vehicle lights or a lighting system 42 (e.g., small or parking lights, vehicle headlights, etc.), or other vehicle components or systems 44 (e.g., audio power button, hands-free call systems, etc.). This enables the backlighting of one or both of the switches 12, 16 to be based on at least one operating condition of the vehicle in which the switches 12, 16 are employed. By way of example, the at least one operating condition of the vehicle could be or correspond to any one or more of the following: an ignition state vehicle (e.g., as determined by the ignition state controller 40); an ON or OFF state of a backup or +B power supply of the vehicle; an ON or OFF state of a lighting system (e.g., parking lights, headlights, etc.) of the vehicle; an ON or OFF state of an audio system of the vehicle; an ON or OFF state of a HVAC system; and/or an ON or OFF state of a communication system (e.g., a hands free call system) of the vehicle.

The ignition state controller 40 can be a switch, push button or other control mechanism for changing the ignition state of the vehicle. In one example (the illustrated embodiment), the controller 40 is a keyed ignition switch having rotatable cylinder with a key slot 40a for receiving an ignition key (e.g., a conventional mechanical key or an electronic key or key fob). Once inserted, the ignition state can be changed by rotating the inserted key. The ignition states could include, for example, an off state, an accessory state (ACC), a run state (IG1) and a start state (IG2). An additional state could be a state wherein the key is removed from the key slot 40a when the ignition state controller 40 is configured to receive a key in the slot 40a.

In an alternate embodiment, the key slot 40a could be replaced with a rotatable switch 40a' or other control device that is rotatable to various positions corresponding to ignition states of the vehicle and thus does not require insertion of a key. In another alternate embodiment, the ignition controller 40 could include a push button 40a", such as the type employed in a push button start system. In this embodiment, changing of the ignition states could be effected by pushing the push button. For example, from an off state the button 40a" could be pressed one time to change the state to the accessory state and could be pressed again to start the vehicle and remain in a run state. A third press of the push button 40a" could change the state back to the off state. It is contemplated that other sequences, etc. could be used with the push button 40a" to change the ignition states.

With reference to FIG. 3, one implementation of the above-described system 10 is illustrated for a vehicle's HVAC system 26' and audio system 28'. In FIG. 3, the at least one first switch is a first group of switches 12' corresponding to a first vehicle sub-system, such as an HVAC system 26'. The at least one second switch is a second group of switches 16' corresponding to another or second vehicle sub-system, such as audio system 28'. As illustrated, the first group of switches 12' can include a plurality of HVAC control switches 50 for controlling the HVAC system 26' through an HVAC system controller 30'. The second group of switches 16' can include a

5

plurality of audio control switches **52** that control the audio system **28'** through an audio system controller **32'**.

Each of the switches **50** can have respective first images (e.g., first image **14**) thereon that are viewable when backlighting **20** is applied to the group of switches **12'** (see FIG. **5B** for example). Similarly, each of the second group of switches **16'** can have respective second images (e.g., second image **18**) thereon that are viewable when backlighting **20** is applied to the second group of switches **16'** (See FIG. **5C** for example). As will be described in more detail below, the backlighting **20** can be applied to one or both of said first group of switches **12'** and the second group of switches **16'** based on at least one an ignition state of the vehicle, an ON or OFF state of a +B or backup power supply **44a** of the vehicle, an ON or OFF state of a lighting system **42** (e.g., parking lights, headlights, etc.) of the vehicle, an ON or OFF state of an audio system **28'** of the vehicle, an ON or OFF state of the HVAC system **26'**, and/or an ON or OFF state of a communication system **44b** (e.g., a hands free call system) of the vehicle.

Also in the embodiment illustrated in FIG. **3**, an audio power switch **54**, which can comprise a third group **56**, can have a third image thereon that is viewable when backlighting **20** is applied to the audio power switch **54** (See FIG. **5C** for example). Like the groups **12'** and **16'**, the backlighting **20** can be applied to the audio power switch **54** based on at least one of the ignition state of the vehicle, the ON or OFF state of a +B or backup power supply **44a** of the vehicle, the ON or OFF state of a lighting system **42** (e.g., parking lights, headlights, etc.) of the vehicle, the ON or OFF state of an audio system **28'** of the vehicle, an ON or OFF state of the HVAC system **26'**, and/or the ON or OFF state of a communication system **44b** (e.g., a hands free call system) of the vehicle.

Backlighting of the groups of switches **12'**, **16'**, **56** can be controlled via backlighting controller **38**. In particular, the controller **38** can independently apply the backlighting **20** to any one or more of the group of HVAC control switches **50**, the group of audio control switches **52** and/or the audio power switch **54**. In addition, in the illustrated embodiment, a display panel **58** can be provided for displaying information associated with the audio system **28'** (See FIG. **5C** for example) and a display panel **60** can be provided for displaying information associated with the HVAC system **26'**. The images on the switches **50**, **52**, **54** are only viewable when backlighting is provided to the groups **12'**, **16'**, **56** in which the switches are included. Absent backlighting, the switches **50**, **52**, **54** have a black-out appearance (see FIG. **2A**) and thus images thereon are not visible even with ambient lighting or other front side lighting.

When the backlighting is based on the ignition state, the states could include an off state, an accessory state, a start state and a run state. When used with a key-type ignition switch or a rotatable switch, the states can correspond to key positions such as: removed from key slot **40a**, inserted in the key slot **40a** and in the OFF position, inserted in the key slot **40a** and in the ACC position, and inserted in the key slot **40a** and in an ON position (e.g., the IG2 position, which can be the normal engine running position). When used with a push button (e.g., push button **40''**) of a push button start system, the ignition states can correspond to depressions of the push button (e.g., a single depression for the accessory state, a second depression for starting and running of the vehicle, and a third depression to revert to the off state). In one exemplary embodiment, the only states of concern are the ACC state and the IG2 state, and backlighting is applied based on whether the ignition switch **40** is in one of these states. When the backlighting is based on the ON or OFF state of a vehicle lighting system **42**, the lighting system **42** can be the vehicle's

6

parking lights such that the backlighting is applied to one or more of the groups **12'**, **16'**, **56** in which the switches are included based on the ON or OFF state of the parking lights. As is known by those skilled in the art, the vehicle can be configured such that the parking lights are always on when the vehicle's headlights are turned on. When the backlighting is based on the ON or OFF state of a communication system **44b** of the vehicle, the communication system **44b** can be a hands free call system of the vehicle such that the backlighting is applied to one or more of the groups **12'**, **16'**, **56** in which the switches are included based on the ON or OFF state of the hands free call system.

Backlighting of the group **12'**, **16'**, **56** can also correspond to an operational status of the groups of switches. For example, backlighting **20** can be applied to the group **12'** only when the switches **50** are active and functional. Likewise, backlighting **20** can be applied respectively to the group **16'** or **56** only when the respective switches **52**, **54** are active and functional. Accordingly, backlighting of the groups **12'**, **16'**, **56**, which can be done independently, can be used to indicate when switches of the groups are active. Independent backlighting allows the groups of switches **12'**, **16'**, **56** to be turned on and off independently.

With reference to FIG. **4**, one exemplary control matrix is illustrated for the backlighting controller **38**, though it is to be appreciated that other control matrices could alternately be employed. In the illustrated control matrix, the operating conditions of the vehicle upon which the backlighting **20** is based include: the ON or OFF state of the backup or +B power supply **44a**, the ignition state of the ignition switch **40** (particularly, whether the state is one of the ACC state or the IG2 state), the ON or OFF state of the audio system **28'**, the ON or OFF state of a hands free call system **44b**, the ON or OFF state of the vehicle's parking lights **42** and the ON or OFF state of the vehicle's HVAC system **26'**.

In the control matrix, the "+B" column **70** represents the backup function or +B power supply **44a** of the vehicle. The "ACC" column **72** represents the accessory state of the ignition switch **40**. The "IG2" column **74** represents the run state of the ignition switch **40**. The "Audio Power" column **76** represents the state (i.e., ON or OFF) of the audio system **28'** as controlled by the audio power button **54**. The "HFL Mode" column **78** represents the state of the hands-free call system **44b**. The "SMALL" column **80** represents the state of the vehicle's small or parking lights **42**, which can be used as an indication representing when the vehicle's headlights are turned on. The "Aircom" column **82** represents the state of the vehicle's HVAC system **26'**, such as when that system **26'** is turned on and is active, or off and inactive. The "VOLUME" column **84** represents the state (i.e., backlighting on or backlighting off) of the audio power button **54**, which also serves to control volume of the audio system **28'**. The "HVAC BUTTONS" column **86** represents the state (i.e., backlighting on or backlighting off) of the HVAC buttons **50** of group **12'** as controlled by the backlighting controller **38**. The AUDIO BUTTONS" column **88** represents the state (i.e., backlighting on or backlighting off) of the audio buttons **52** of group **16'**.

The "AUDIO BUTTONS" column **88** represents the state (i.e., backlighting on or backlighting off) of the audio buttons **52** of group **16'**.

As will be appreciated from the control matrix of FIG. **4**, the HVAC switches **50** of the first group **12'** are active and thus backlit via backlighting **20** at all times when the ignition switch **40** is in the run state (i.e., IG2) as indicated in column **74**. Such backlighting can correspond to a day or night state of the vehicle. For example, when the vehicle's headlights are turned OFF as indicated in column **80**, a day brightness set-

7

ting can be applied, whereas when the headlights are ON, a dimmer night brightness level can be applied. Sometimes per regulations, the HVAC switches 50, or more particularly the images thereon, are required to be visible whenever the vehicle headlights are on. Accordingly, anytime the vehicle's headlights are turned on as indicated in column 80, the HVAC buttons 50 (i.e., group 12') are turned on to one of the day or night brightness settings.

As indicated in column 88, the audio power switch 54 is backlit and active anytime the ignition switch 40 is set for the ACC state, which is indicated in column 72, or in the run state (i.e., IG2), which is indicated in column 74. Again, day and night brightness levels can be used corresponding to whether the vehicle's headlights are turned on or off which is indicated in column 80. Additionally, the audio power switch 54 can be backlit and active even when the ignition switch 40 is set for the ACC state or in the run state (columns 72 and 74) if the hands-free call system 44b is being used (e.g., a hands-free call is in progress), which is indicated in column 78. The audio switches 52 of group 16' can be backlit and active whenever the ignition switch 40 is set for the ACC or run key states (columns 72 and 74) and the audio system 28' is powered on, which is indicated in column 76.

Turning to FIG. 5, the various states of the groups 12', 16', and 56 are shown corresponding to the matrix table of FIG. 4. In particular, FIG. 5A illustrates all switches 50, 52, 54 of the groups 12', 16', and 56 turned off (i.e., no backlighting and thus black-out appearance). FIG. 5B illustrates the condition wherein the ignition state of the ignition switch 40 is off (i.e., not in the ACC or run states), but the headlights are turned on, thus the HVAC switches 50 of group 12' are backlit. FIG. 5C illustrates the condition where the ignition state of the ignition switch 40 is the ACC state, the audio system 28' is turned on, and the headlights are turned off as indicated by the parking lights 42. As shown, in this condition, the switches 52 of group 16' are backlit and active. FIG. 5D illustrates the condition where the ignition state of the ignition switch 40 is in the ACC state, the audio system 28' is turned off, and the headlights are turned off; thus, none of the groups 12', 16', 56 of switches 50, 52, 54 are backlit or active (i.e., all are blacked-out). FIG. 5E illustrates the condition where the ignition switch 40 is in the run position (i.e., IG2), the audio system 28' is turned off, and the headlights are on or off. As shown, in this condition, the switches 50 of group 12' are backlit and active. FIG. 5F illustrates the condition where the ignition state of the ignition switch 40 is the run state, the audio system 28' is on, and the headlights are turned on or off. In this condition, all groups 12', 16', 56 of switches 52, 54 are backlit and active. FIG. 5G illustrates the condition where the ignition state of the ignition switch 40 is the ACC position, the audio system 28' is on and the headlights are turned on. In this condition, all groups 12', 16', 56 of switches 52, 54 are backlit and active.

According to the foregoing, and with reference to FIG. 6, a switch image control method for a vehicle will now be described. In the illustrated method, at least one first switch 12 (or the switches 50 of the first group 12') is provided having a first image 14 (S100) and at least one second switch 16 (or the switches 52 of the second group 16') is provided having a second image 18 (S102). The method can further include the provision of a third switch (e.g., the audio power switch 54) having the third image thereon (S104). One or more of the first switch 12, the second switch 16 and the third switch 54 are selectively and independently backlit to illuminate the images thereon based on at least one operating condition of the vehicle (S106). As already described, the at least one operating condition can include one or more of: the state of

8

the ignition switch 40, the ON or OFF state of a +B or backup power supply 44a, the ON or OFF state of a lighting system 42 (e.g., parking lights, headlights, etc.), the ON or OFF state of the audio system 28', the ON or OFF state of the HVAC system 26', and/or the ON or OFF state of a communication system 44b.

When no backlighting is applied to the first switch 12, the first image 14 is blacked-out (S108). When no backlighting is applied to the second switch 16, the second image 18 is blacked-out (S110). Likewise, when no backlighting is applied to the third switch 54, the third image is blacked-out (S112). Backlighting of the switches 12, 16, 54 to illuminate the respective first, second and third images (e.g., in S104) occurs only when the respective switches 12, 16, 54 are active. Such backlighting can be in accordance with the control matrix of FIG. 4.

It will be appreciated that several of the above-disclosed and other features and functions, or alternative thereof, may be desirably combined into many other different systems or applications. Also that various presently unforeseen or unanticipated alternatives, modifications, variations or improvements therein may be subsequently made by those skilled in the art which are also intended to be encompassed by the following claims.

The invention claimed is:

1. A switch image control system for a vehicle, comprising:
  - at least one first switch corresponding to a first vehicle sub-system having a first image viewable when backlighting is applied to said at least one first switch, wherein said first image is representative of a function of said at least one first switch; and
  - at least one second switch corresponding to a second vehicle sub-system having a second image viewable when said backlighting is applied to said at least one second switch, wherein said second image is representative of a function of said at least one second switch, wherein said backlighting is independently applied to one or both said at least one first switch and said at least one second switch based on at least one operating condition of the vehicle, wherein the operating condition represents the function of at least one of the at least one first switch or the at least one second switch.
2. The switch image control system of claim 1 wherein said at least one operating condition corresponds to at least one of an ON or OFF state of a lighting system of the vehicle, an ON or OFF state of an audio system of the vehicle, an ON or OFF state of a heating, ventilation, air conditioning system (HVAC system) of the vehicle, an ON or OFF state of a communication system of the vehicle.
3. The switch image control system of claim 2 wherein said lighting system is parking lights of the vehicle, and wherein said backlighting is applied to one or both said at least one first switch and said at least one second switch based on an ON or OFF state of said parking lights.
4. The switch image control system of claim 2 wherein said communication system is a hands free call system of the vehicle, and wherein said backlighting is applied to one or both said at least one first switch and said at least one second switch based on an ON or OFF state of said hands free call system.
5. The switch image control system of claim 1 further including:
  - a first subsystem controller corresponding to said first subsystem and a second subsystem controller corresponding to said second subsystem wherein said first sub-

9

system corresponds to said first switch and said second sub-system corresponds to said second switch.

6. The switch image control system of claim 5 wherein input of said first switch is communicated to said first sub-system controller and input of said second switch is communicated to said second sub-system controller wherein a backlighting controller receives indications from at least one of said first sub-system controller or second sub-system controller based on at least one of input of said first switch, or input of said second switch.

7. The switch image control system of claim 6 wherein said backlighting controller provides actuation to initialize said backlighting to be applied to one or both of said first switch or said second switch based on at least one of the following: said operating condition of the vehicle, receiving an indication from said first sub-system controller, or receiving said indication from said second sub-system controller.

8. The switch image control system of claim 7 wherein application of said backlighting to said at least one first switch corresponds with an operational status of said at least one first switch, and application of said backlighting to said at least one second switch corresponds to an operational status of said at least one second switch.

9. The switch image control system of claim 1 wherein said first image is viewable only when said backlighting is applied to said at least one first switch, otherwise said at least one first switch has a black-out appearance, and said second image is viewable only when said backlighting is applied to said at least one second switch, otherwise said at least one second switch has a black-out appearance.

10. The switch image control system of claim 9 wherein said first image and said second image are not visible with ambient lighting or front side lighting when said backlighting is not applied to said at least one first switch and said at least one second switch.

11. A switch image control system for a vehicle, comprising:

a first group of switches having first images viewable thereon when backlighting is applied thereto, said first group of switches corresponding to a first vehicle sub-system, wherein said first images are representative of a function of said first group of switches;

a second group of switches having second images viewable thereon when said backlighting is applied thereto, said second group of switches corresponding to a second vehicle sub-system, wherein said second images are representative of a function of said second group of switches; and

a third switch having a third image viewable thereon when said backlighting is applied thereto, wherein said third image is representative of a function of said third switch, wherein one or more of said first group of switches, said second group of switches, and said third switch are selectively and independently backlit to illuminate the images thereon based on at least one operating condition of the vehicle,

wherein the operating condition represents the function of at least one of the at least one first group of switches or the at least one second group of switches.

12. The switch image control system of claim 11 wherein said first group of switches includes a heating, ventilation, air conditioning system (HVAC system) control switches and said first vehicle sub-system is the HVAC system, and wherein said second group of switches includes audio control switches and said second vehicle sub-system is an audio system.

10

13. The switch image control system of claim 12 wherein said backlighting of said first group of switches indicates said HVAC system control switches are active, and said backlighting of said second group of switches indicates said audio control switches are active.

14. The switch image control system of claim 13 wherein said backlighting is applied to each of said first group of switches, and said second group of switches based on at least one of an ON or OFF state of a lighting system of the vehicle, an ON or OFF state of said audio system of the vehicle, an ON or OFF state of said HVAC system of the vehicle, and an ON or OFF state of a communication system of the vehicle.

15. A The switch image control system for a vehicle, comprising:

a first group of switches having first images viewable thereon when backlighting is applied thereto, said first group of switches corresponding to a first vehicle sub-system;

a second group of switches having second images viewable thereon when said backlighting is applied thereto, said second group of switches corresponding to a second vehicle sub-system; and

a third switch having a third image viewable thereon when said backlighting is applied thereto,

wherein one or more of said first group of switches, said second group of switches, and said third switch are selectively and independently backlit to illuminate the images thereon based on at least one operating condition of the vehicle, and

wherein said third switch includes an audio power switch and said backlighting is applied to said audio power switch based on at least one of: an ON or OFF state of a lighting system of the vehicle, an ON or OFF state of an audio system of the vehicle, an ON or OFF state of a heating, ventilation, air conditioning system (HVAC system) of the vehicle, and an ON or OFF state of a communication system of the vehicle.

16. A switch image control method for a vehicle, comprising:

providing at least one first switch having a first image corresponding to a first vehicle sub-system, wherein said first image is representative of a function of said at least one first switch;

providing at least one second switch having a second image corresponding to a second vehicle sub-system, wherein said second image is representative of a function of said at least one second switch; and

selectively and independently backlighting one or both of said at least one first switch to illuminate said first image and said at least one second switch to illuminate said second image based on at least one operating condition of the vehicle,

wherein the operating condition represents the function of at least one of the at least one first switch or the at least one second switch.

17. The switch image control method of claim 16 wherein said at least one operating condition corresponds to at least one of an ON or OFF state of a lighting system of the vehicle, an ON or OFF state of an audio system of the vehicle, an ON or OFF state of a heating, ventilation, air conditioning system (HVAC system) of the vehicle, or an ON or OFF state of a communication system of the vehicle.

18. The switch image control method of claim 17, wherein said one first switch includes an HVAC control switch and said first vehicle sub-system is the HVAC system, and

wherein said one second switch includes an audio control switch and said second vehicle sub-system is the audio system.

**19.** The switch image control method of claim **16** further including:

providing a third switch which includes an audio power switch having a third image; and

selectively and independently backlighting said audio power switch to illuminate said third image based on said at least one operating condition of the vehicle.

**20.** The switch image control method of claim **16** further including:

blackening out said first image when no backlighting is applied to said first switch;

blackening out said second image when no backlighting is applied to said second switch;

blackening out a third image when no backlighting is applied to a third switch;

wherein said first image, said second image, and said third image are not visible with ambient lighting or front side lighting when said backlighting is not applied to said at least one or more of said first switch, said second switch, or said third switch.
